PAPER

**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

<b>Office Action Summary</b>	Application No. 10/537,942	Applicant(s) CURRAN ET AL.	
	Examiner DANIEL MILLER	Art Unit 1783	

**-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --**

### Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period **will** apply and **will** expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply **will**, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

### Status

- 1) ☒ Responsive to communication(s) filed on 1/29/2010.
- 2a) ☒ This action is **FINAL**.                      2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

### Disposition of Claims

- 4) ☒ Claim(s) 1-38 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-38 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

### Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

### Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All    b) ☐ Some \*    c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

## DETAILED ACTION

### ***Claim Rejections - 35 USC § 103***

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. Claims 1-3, 7-33, 36-38 are rejected under 35 U.S.C. 103(a) as being unpatentable over Halas et al (US 6,778,316) in view of Azamian (direct observation of covalent coupling of quantum dots to single walled carbon nanotubes).

3. Halas teaches a sensor comprising: an optical device; and a thin film supported by said device, said thin film comprising a matrix; a plurality of Plasmon resonant particles (chromophores) embedded in said matrix; and a plurality of carbon nanotubes embedded in said matrix (see claim 4 ref.).

4. *The sensor of Halas can* comprise a light directing surface comprising a surface of a waveguide (as required by applicant's claim 38); and an optical enhancing member comprising: a matrix; and a plurality of resonant nanoparticles embedded in said matrix, wherein said optical enhancing member is disposed so as to modify the optical response of the optical sampling member (see claim 7 ref.).

5. Halas does not teach providing chromophores attached to defect sites.

6. Azamian teaches covalent bonding of single walled nanotubes to metal nanoparticles through defect sites (see first paragraph column 1).

7. It would have been obvious to one of ordinary skill in the art at the time of the invention to provide covalent bonding of single walled nanotubes to metal nanoparticles through defect sites, as taught by Azamian, in the optical device of Halas in order to enhance electrical and optical properties by development of low resistance Ohmic contacts advantageous for nanoelectronic applications (see first column and figures of Azamian).

8. *Regarding claims 2-3 and 31-33, the gold chromophores are connected to an organic molecule and are considered to meet the definition of a nanoparticles, colloids, or nanocluster. Specifically regarding claim 3, the chromophores are considered to be chemisorbed by the organic attachment to the nanotube (see figures). No patentable distinction is seen.*

9. Regarding claims 7 and 27, Azamian teaches the functional group of the defect site is a carboxylic acid (see first column) which covalently bonds to a chromophore.

10. Regarding claim 9, the matrix can be a polymer matrix (see Halas).

11. Regarding claims 10-12, the nanoparticles may be mixed into the fluid precursor prior to deposition (column 6 lines 1-5). Metal nanoshells (chromophores) can be mixed in Halas into various polymers including PVA, polyvinylpropylene (PVP), polymethylmethacrylate (PMMA), and polydimethylsiloxane (PDMS) (see column 6 lines 1-20). Therefore a wide variety of polymers would have been obvious to provide with anticipated success by one of ordinary skill. Regarding claim 12, the nanotubes are formed on a substrate which would be expected to determine the stiffness of the material as claimed. No patentable distinction is seen.

Art Unit: 1783

12. Regarding claim 13, the nanotubes can be aligned (see Halas).

13. Regarding claim 14, to the extent to which applicant has defined the terms "SuperNanoMolecular" and "non-centrosymmetric" the combined teachings are considered to read on applicant's claimed invention. No patentable distinction is seen.

14. Regarding claims 15 and 16, the morphology can be controlled by the amount of constituent materials used and the covalently bound (see figures Azamian) chromophores binding can be controlled to a predetermined number of defect sites by varying the oxidation procedure controlling tube wall fictionalization (see last column second page Azamian).

15. As stated above, regarding claims 17-18 and 37, the material is considered a non-linear optical material that forms a device, specifically a waveguide (see claim of Halas above), as claimed. No patentable distinction is seen

16. Regarding claims 19-21 and 36, regarding applicant's claim to films exhibiting X effects it would have been obvious to one of ordinary skill in the art at the time of the invention to provide a variety of optical properties consistent with the intended use of the device by modifying the level of fictionalization and concentration of materials in the matrix. No patentable distinction is seen.

17. The limitations of claim 22 are addressed above.

18. Regarding claims 3 and 23-24, the metal nanoparticle (chromophores) are considered to be "chemisorbed" to the defect site as claimed (see Azamian generally and figures).

Art Unit: 1783

19. Regarding claims 8 and 25-28, applicant's has claimed acid functionalized and anionic initiators comprising alkyllithium salts it would have been obvious to one of ordinary skill in the art at the time of the invention to provide a wide variety of functionalized consistent with basic organic chemistry functionalized techniques known to one of ordinary skill in the art. No patentable distinction is seen.

20. Regarding claim 29 and 30, the matrix can be a polymer matrix and the polymer matrix is considered flexible (see Halas).

21. Regarding claim 38, as discussed above, the material is incorporated into a waveguide (claim 7 Halas).

22. Claims 4-6 and 34-35 are rejected under 35 U.S.C. 103(a) as being unpatentable over Halas et al (US 6,778,316) in view of Azamian (direct observation of covalent coupling of quantum dots to single walled carbon nanotubes) further in view of Neuschafer et al (US 6,078,705).

23. Halas et al (US 6,778,316) in view of Azamian (direct observation of covalent coupling of quantum dots to single walled carbon nanotubes), discussed above do not appear to teach an organic dye.

24. Neuschafer et al (US 6,078,705) teaches an optical waveguide which may use luminescent compounds functionalized luminescent dyes having a luminescence of a wavelength in the range of from 330 nm to 1000 nm, such as polypyridyl/ **Phenazine**/ ruthenium complexes, platinum/porphyrin complexes, such as octaethyl-platinum-

Art Unit: 1783

porphyrin, long-lived europium and terbium complexes or cyanine dyes (see column 17 lines 1-16). Especially suitable for analyses in blood or serum are dyes having absorption and emission wavelengths in the range of from 600 to 900 nm (see column 17 lines 15-20).

25. It would have been obvious to one of ordinary skill in the art at the time of the invention to use a **Phenazine** dye, as disclosed by Neuschafer, including the claimed PSF (phenosafranin) phenazine dye, in order to enhance waveguide properties especially wherein the waveguide is employed for analyses in blood or serum are dyes where having absorption and emission wavelengths in the range of from 600 to 900 nm (see column 17 lines 15-20), are especially suitable. No patentable distinction is seen.

### ***Response to Arguments***

26. Applicant's arguments filed 1/29/2010 have been fully considered but they are not persuasive.

27. In response to applicant's arguments against the references individually, one cannot show nonobviousness by attacking references individually where the rejections are based on combinations of references. See *In re Keller*, 642 F.2d 413, 208 USPQ 871 (CCPA 1981); *In re Merck & Co.*, 800 F.2d 1091, 231 USPQ 375 (Fed. Cir. 1986).

28. In response to applicant's argument that Halas (the primary reference) does not teach the incorporation of nanoparticles into defect sites of the nanotubes or that the incorporation of those particles would change the resonance, the test for obviousness

Art Unit: 1783

is not whether the features of a secondary reference may be bodily incorporated into the structure of the primary reference; nor is it that the claimed invention must be expressly suggested in any one or all of the references. Rather, the test is what the combined teachings of the references would have suggested to those of ordinary skill in the art.

See *In re Keller*, 642 F.2d 413, 208 USPQ 871 (CCPA 1981).

29. Applicant's arguments that the incorporation of nanoparticles into the defect sites of Halas destroys the primary function of the reference and/or changes the properties of the primary references is also unconvincing. The fact that a combination under 103 may lead to different properties in comparison to a reference unaltered does not lead to a teaching a way, destruction of primary function, or otherwise lead to a finding of non-obviousness. One of ordinary skill would naturally look to optimize or otherwise improve the art in light of what was known to one of ordinary skill.

30. It would have been obvious to one of ordinary skill in the art at the time of the invention to provide covalent bonding of single walled nanotubes to metal nanoparticles through defect sites, as taught by Azamian, in the optical device of Halas in order to enhance electrical and optical properties by development of low resistance Ohmic contacts advantageous for nanoelectronic applications (see first column and figures of Azamian).

31. Rejection maintained.

***Conclusion***

32. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to DANIEL MILLER whose telephone number is (571)272-1534. The examiner can normally be reached on M-Th.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, David Sample can be reached on (571)272-1376. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
